Abstract:
Natural Language Processing (NLP) is increasingly being utilized across various sectors, including higher education, to extract meaningful insights from textual data. This study aims to explore the application of NLP techniques in higher education by analysing a dataset sourced from Kaggle, which includes academic articles, student feedback, and other relevant text data. The methodology involves data pre-processing steps such as tokenization, lemmatization, and removal of stopwords, followed by exploratory data analysis, topic modelling, sentiment analysis, and text classification. The results indicate that topic modelling successfully identified key themes within the text, revealing distinct areas of interest and concern in higher education. Sentiment analysis provided a comprehensive understanding of the overall sentiment distribution, highlighting areas of positive and negative feedback. The text classification model demonstrated robust performance, accurately categorizing text data into predefined sentiment categories. This comprehensive analysis showcases the potential of NLP applications in higher education, offering valuable insights into academic and administrative processes. The findings suggest that institutions can leverage NLP to enhance decision-making, improve student satisfaction, and streamline administrative tasks. Future work can focus on refining model accuracy and exploring additional NLP applications such as automated grading and intelligent tutoring systems.

Abstract - Every industry in the modern era is struggling to gain competitiveness and the main mantra for that is to be efficient in as many areas as you can. Using technology to complement the brain power of human beings is a great combination to gain competitiveness. In other words, human intelligence along with artificial intelligence can enhance the efficiency of any industry up to any limit. Using a set of algorithms and making the machine to learn from the environmental factors is the future of gaining efficiency in any industry. This paper studies the importance of using artificial intelligence in the retail sector in particular, how predictive analytics can help in determining what the buyer will buy in how much time, optimum utilization of resources, the emergence of ‘new retailing’. In this paper, comparative analyses of the major outcomes are formulated in the form of a table and find out the direction of the research in this field.

Keywords - *artificial intelligence, machine learning, retail management, predictive analysis, new retailing, internet of things.*

INTRODUCTION

A set of processes that can provide results on the basis intelligence demonstrated by machines and without any need to every time explicitly instructing the machines to do so. Over the time these machines learn to replicate the actions of human beings known as machine learning.

1.1 How Artificial Intelligence (AI) actually works?

For understanding this we have to gain knowledge about various sub-categories of AI and how it could be applied to the industry concerned. Sub-domains that we need to understand are:

Machine Learning: ML identifies patterns and analyses past data collected by the machine for drawing an inference in reaching the best possible conclusion without any need for human interference.

Deep Learning: It is a technique used by ML to help machine in processing inputs through layers. It classifies, infer and provide predictive outcome.
